About Gel Kit

The versatile Gel Kit is designed to make it easy to blend flash with ambient light to make lighting look natural and beautiful.

The gel is clicked on to the flash with a smart magnetic mount. It can easily be stacked with other modifiers.

The kit consists of 4 different gels that are stored in the case together with the gel holder.

The gels are made of a high temperature resistant material, however all gels are affected by heat. Shoot faster and on higher power output, and you will inevitably shorten their lifetime. Shoot less fast and on lower power, and the lifetime increases.

Note that visual marks or smaller deformations does not have any effect on its performance.

**Get started with
your new Gel Kit**

1 Open the magnetic lid of the gel case

- 2 Select one of the color gels and the gel holder. Each gel has a type marking on one of the 'ears'. Place the gel into the holder. The 'ears' of the gel should be positioned between the magnets in the gel holder.

- 3 Secure the gel in the holder by attaching the metal ring on top of the color gel. The white dot on the ring should be aligned with the protruding part of the gel holder.

- 4 Click the gel in place in front of the flash lens

- 5 You can stack more Light Shaping Tools together if needed

- 6 To remove or change the gel, press firmly with a finger from the backside
